

Gmail Tip #26: Creating a Pseudo Address Group!

Gmail currently does not provide the facility to send emails to a Group or a List or email addresses. But thanks to an excellent tip submitted by “arianj”, we now have a very doable workaround! Read on to see how to set up a pseudo Group Contact...

Although Gmail doesn't currently support Groups in your Contacts, you can simulate a Group list by doing the following:

1. Create a new Contact
2. In the “Name” field, enter the name of your Group (eg “My Friends”)
3. In the “E-mail” field, enter your list of email addresses in the following format:

friend1@gmail.com>,<friend2@blah.com>,<friend3@foo.com

Note three things:

1. You must enter “>,<” (without the quotes) between all addresses
2. Be sure NOT to include a leading “<” or trailing “>”. This is intentional, because during auto-complete, Gmail adds these characters to the beginning and end of the full string that is in the e-mail field.
3. Also, there should be no spaces in the string.

Again, thanks to “arianj” for submitting this tip!
