

iPod Touch Tip #3: Safari Screen Rotation

Here's a simple, yet not always intuitive tip. Have you ever been using Safari while lying down in bed or on a couch? You get comfortable, and as you tilt your iPod Touch, does the screen auto-rotate the wrong way? You then go through the delecate balancing act of finding that "sweet spot" just before it rotates, then you cock your head uncomfortably, just to view Safari in widescreen mode? Well, the solution is so simple, if you follow Apple's intuitive UD design. Because the iPod Touch only rotates 90Â° in either direction, once it is rotated, it will not rotate further. So when rotating yout iPod Touch, simply rotate it in direction you are lying. For example, if you lye down on your right side, rotate it clockwise. If you turn over to your left side, rotate it counter-clockwise.
